## OPC FOUNDATION

---

### UNIFIED ARCHITECTURE –

#### FOREWORD

This specification is for developers of OPC UA clients and servers. The specification is a result of an analysis and design process to develop a standard interface to facilitate the development of servers and clients by multiple vendors that shall inter-operate seamlessly together.

Copyright © 2006, 2007 OPC Foundation, Inc.

#### AGREEMENT OF USE

##### COPYRIGHT RESTRICTIONS

Any unauthorized use of this specification may violate copyright laws, trademark laws, and communications regulations and statutes. This document contains information which is protected by copyright. All Rights Reserved. No part of this work covered by copyright herein may be reproduced or used in any form or by any means--graphic, electronic, or mechanical, including photocopying, recording, taping, or information storage and retrieval systems--without permission of the copyright owner.

OPC Foundation members and non-members are prohibited from copying and redistributing this specification. All copies must be obtained on an individual basis, directly from the OPC Foundation Web site <http://www.opcfoundation.org>.

##### PATENTS

The attention of adopters is directed to the possibility that compliance with or adoption of OPC specifications may require use of an invention covered by patent rights. OPC shall not be responsible for identifying patents for which a license may be required by any OPC specification, or for conducting legal inquiries into the legal validity or scope of those patents that are brought to its attention. OPC specifications are prospective and advisory only. Prospective users are responsible for protecting themselves against liability for infringement of patents.

##### WARRANTY AND LIABILITY DISCLAIMERS

WHILE THIS PUBLICATION IS BELIEVED TO BE ACCURATE, IT IS PROVIDED "AS IS" AND MAY CONTAIN ERRORS OR MISPRINTS. THE OPC FOUNDATION MAKES NO WARRANTY OF ANY KIND, EXPRESSED OR IMPLIED, WITH REGARD TO THIS PUBLICATION, INCLUDING BUT NOT LIMITED TO ANY WARRANTY OF TITLE OR OWNERSHIP, IMPLIED WARRANTY OF MERCHANTABILITY OR WARRANTY OF FITNESS FOR A PARTICULAR PURPOSE OR USE. IN NO EVENT SHALL THE OPC FOUNDATION BE LIABLE FOR ERRORS CONTAINED HEREIN OR FOR DIRECT, INDIRECT, INCIDENTAL, SPECIAL, CONSEQUENTIAL, RELIANCE OR COVER DAMAGES, INCLUDING LOSS OF PROFITS, REVENUE, DATA OR USE, INCURRED BY ANY USER OR ANY THIRD PARTY IN CONNECTION WITH THE FURNISHING, PERFORMANCE, OR USE OF THIS MATERIAL, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

The entire risk as to the quality and performance of software developed using this specification is borne by you.

##### RESTRICTED RIGHTS LEGEND

This Specification is provided with Restricted Rights. Use, duplication or disclosure by the U.S. government is subject to restrictions as set forth in (a) this Agreement pursuant to DFARs 227.7202-3(a); (b) subparagraph (c)(1)(i) of the Rights in Technical Data and Computer Software clause at DFARs 252.227-7013; or (c) the Commercial Computer Software Restricted Rights clause at FAR 52.227-19 subdivision (c)(1) and (2), as applicable. Contractor / manufacturer are the OPC Foundation, 16101 N. 82nd Street, Suite 3B, Scottsdale, AZ, 85260-1830

##### COMPLIANCE

The OPC Foundation shall at all times be the sole entity that may authorize developers, suppliers and sellers of hardware and software to use certification marks, trademarks or other special designations to indicate compliance with these materials. Products developed using this specification may claim compliance or conformance with this specification if and

only if the software satisfactorily meets the certification requirements set by the OPC Foundation. Products that do not meet these requirements may claim only that the product was based on this specification and must not claim compliance or conformance with this specification.

#### TRADEMARKS

Most computer and software brand names have trademarks or registered trademarks. The individual trademarks have not been listed here.

#### GENERAL PROVISIONS

Should any provision of this Agreement be held to be void, invalid, unenforceable or illegal by a court, the validity and enforceability of the other provisions shall not be affected thereby.

This Agreement shall be governed by and construed under the laws of the State of Minnesota, excluding its choice of law rules.

This Agreement embodies the entire understanding between the parties with respect to, and supersedes any prior understanding or agreement (oral or written) relating to, this specification.

#### ISSUE REPORTING

The OPC Foundation strives to maintain the highest quality standards for its published specifications, hence they undergo constant review and refinement. Readers are encouraged to report any issues and view any existing errata here: <http://www.opcfoundation.org/errata>

## 1 Scope

This specification specifies the standard representation of *Programs* as part of the OPC Unified Architecture and its defined information model. This includes the description of the *NodeClasses*, standard *Properties*, *Methods* and *Events* and associated behaviour and information for *Programs*.

The complete address space model including all *NodeClasses* and *Attributes* is specified in [UA Part 3]. The services such as those used to invoke the *Methods* used to manage *Programs* are specified in [UA Part 4].

## 3 Terms, definitions, and abbreviations

### 3.1 OPC UA Part 1 terms

The following terms defined in [UA Part 1] of this multi-part specification apply.

- 1) EventType
- 2) Information Model
- 3) Method
- 4) Node
- 5) NodeClass
- 6) Notification
- 7) Object
- 8) ObjectInstance
- 9) ObjectType
- 10) Program
- 11) Reference
- 12) ReferenceType
- 13) Service
- 14) Session
- 15) Subscription

## 16) Variable

### 3.2 OPC UA Part 3 terms

The following terms defined in [UA Part 3] apply.

1. TypeDefinition Node
2. Property
3. Variable

### 3.3 OPC UA Program terms

The following terms are defined for UA Programs.

#### 3.3.1 Function

A Function is a programmatic task performed at a server or device, usually accomplished by computer code execution.

#### 3.3.2 Program

A Program is a complex *Function* in a server or underlying system that can be invoked and managed by an OPC UA Client.

#### 3.3.3 Finite State Machine

A Finite State Machine is a sequence of states and valid state transitions along with the causes and effects of those state transitions that define the actions of a *Program* in terms of discrete stages.

#### 3.3.4 ProgramType

A ProgramType is an *ObjectType Node* that represents the type definition of a *Program* and is a subtype of the *StateMachineType*.

#### 3.3.5 Program Control Method

A Program Control Method is a *Method* specified by this specification having specific semantics designed for the control of a *Program* by causing a state transition.

#### 3.3.6 Program Invocation

A Program Invocation is a unique *Object* instance of a *Program* existing on a *Server*. The Program Invocation is distinguished from other *Object* instances of the same *ProgramType* by the object node's unique browse path.

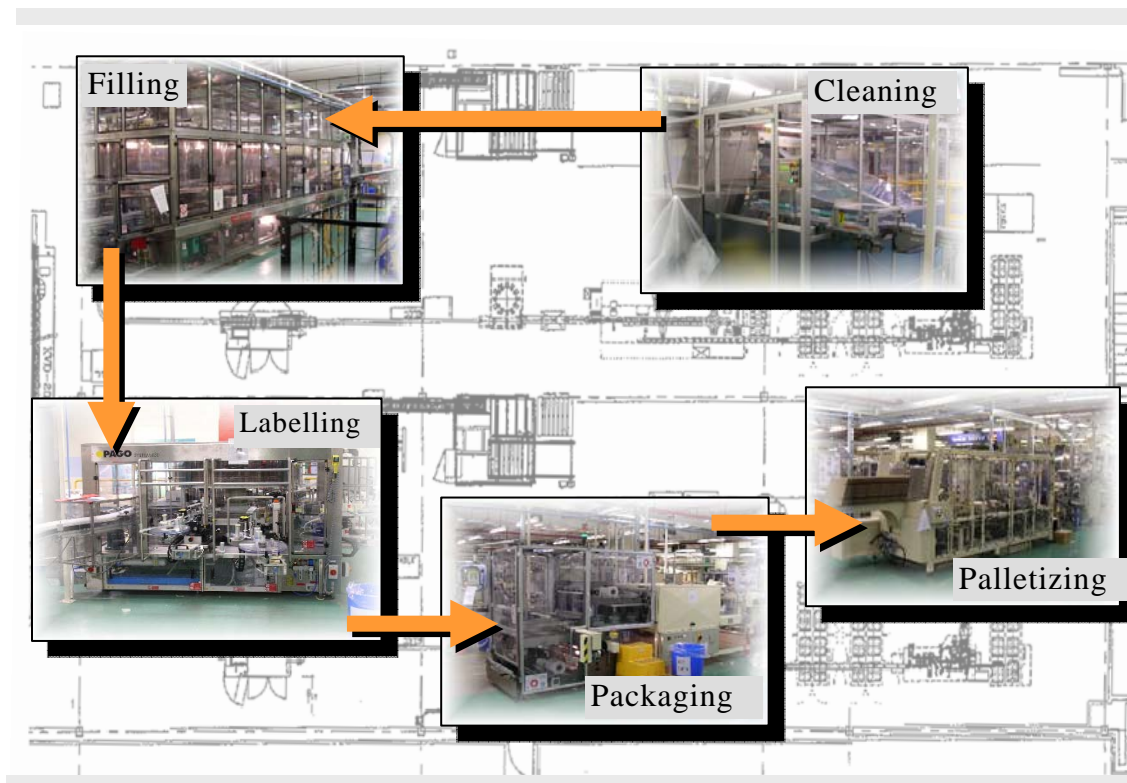

### 3.4 Abbreviations and symbols

API	Application Programming Interface
DA	Data Access
FSM	Finite State Machine
HMI	Human Machine Interfaces
PCM	Program Control Method
PGM	Program
PI	Program Invocation
PLC	Programmable Logic Controller
UA	Unified Architecture
UML	Unified Modelling Language

## 4 Concepts

### 4.1 General

Integrated automation facilities manage their operations through the exchange of data and coordinated invocation of system functions. Services are required to perform the data exchanges and to invoke the functions that constitute system operation. These functions may be invoked through human machine Interfaces, cell controllers, or other supervisory control and data acquisition type systems. OPC UA defines *Methods* and *Programs* as an interoperable way to advertise, discover, and request these functions. They provide a normalizing mechanism for the semantic description, invocation of, and result reporting of these functions. Together *Methods* and *Programs* complement the other OPC UA *Services* and *ObjectTypes* to facilitate the operation of an automation environment using a client server hierarchy.

**Figure 1 - Automation Facility Control**

*Methods* and *Programs* model functions typically having different scopes, behaviours, lifetimes, and complexities in *OPC Servers* and the underlying systems. These functions are **not** normally characterized by the reading or writing of data which is accomplished with the OPC UA *Attribute* service set.

*Methods* represent basic functions in the server that can be invoked by a client. *Programs* by contrast, model more complex, stateful functionality in the system. For example, a method call may be used to perform a calculation or reset a counter. A *Program* is used to run and control a batch process, execute a machine tool part program, or manage a domain download. *Methods* and their invocation mechanism are described in [UA Part 3] – Address Space Model and [UA Part 4] – Services. This specification describes the extensions to, or specific use of the core capabilities defined in the first seven parts of the OPC UA multi-part specification required for *Programs*. Support for the feature described in this specification are described in [UA Part 7] – Profiles

4.2 Programs

4.2.1 Overview

*Programs* are complex functions in a server or underlying system that can be invoked and managed by an OPC UA Client. *Programs* can represent any level of functionality within a system or process in which client control or intervention is required and progress monitoring is desired.

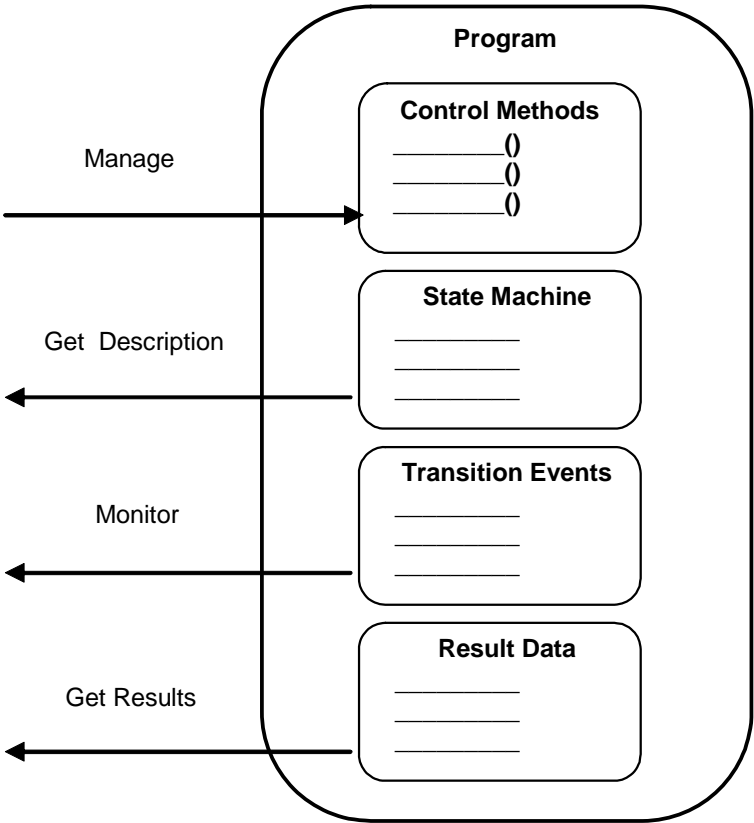

Figure 2 - Program Illustration

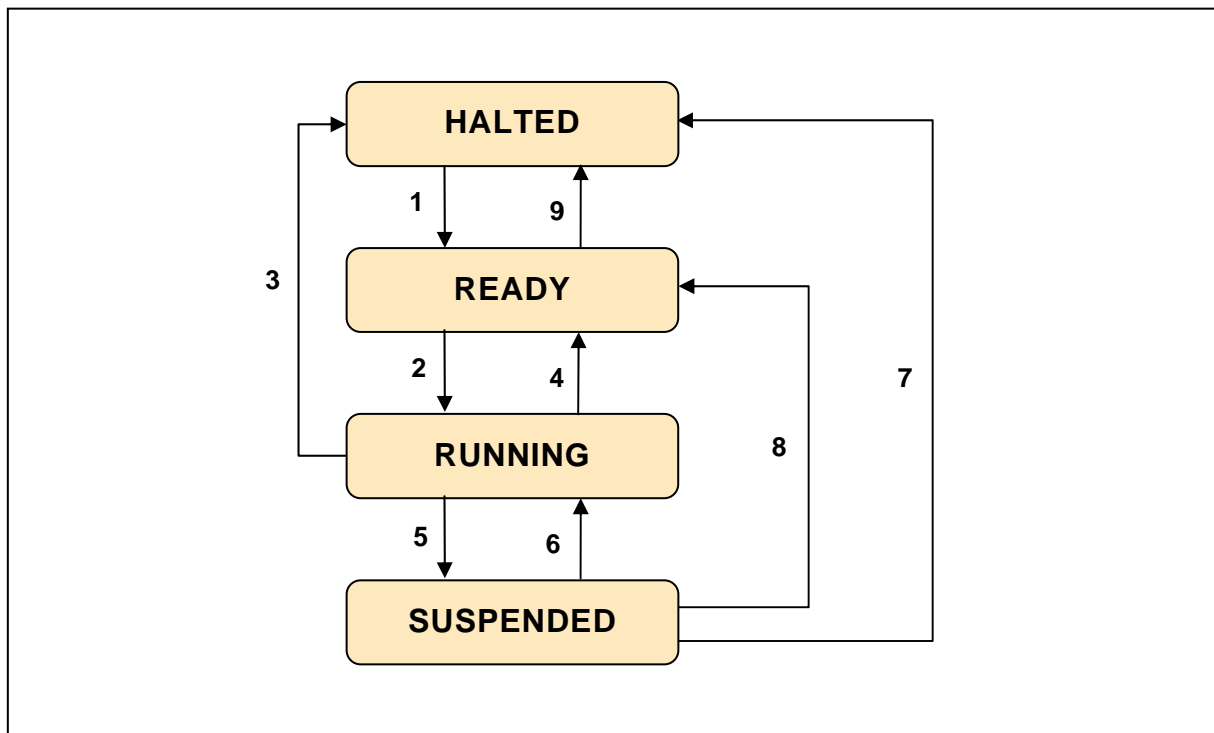

*Programs* are state full, transitioning through a prescribed sequence of states as they execute. Their behaviour is defined by a *Program Finite State Machine (PFSM)*. The elements of the PFSM describe the phases of a *Program*’s execution in terms of valid transitions between a set of states, the stimuli or causes of those transitions, and the resultant effects of the transitions.

4.2.2 Program Finite State Machine

The statues, transitions, causes and effects that compose the Program Finite State Machine are listed in Table 1 and illustrated in Figure 3.

**Table 1 - Program Finite State Machine**

No.	Transition Name	Cause	From State	To State	Effect
1	HaltedToReady	Reset Method	Halted	Ready	Report Transition 1 Event/Result
2	ReadyToRunning	Start Method	Ready	Running	Report Transition 2 Event/Result
3	RunningToHalted	Halt Method or Internal (Error)	Running	Halted	Report Transition 3 Event/Result
4	RunningToReady	Internal	Running	Ready	Report Transition 4 Event/Result
5	RunningToSuspended	Suspend Method	Running	Suspended	Report Transition 5 Event/Result
6	SuspendedToRunning	Resume Method	Suspended	Running	Report Transition 6 Event/Result
7	SuspendedToHalted	Halt Method	Suspended	Halted	Report Transition 7 Event/Result
8	SuspendedToReady	Internal	Suspended	Ready	Report Transition 8 Event/Result
9	ReadyToHalted	Halt Method	Ready	Halted	Report Transition 9 Event/Result

**Figure 3 - Program States and Transitions**

#### 4.2.3 Program States

A standard set of base states are defined for *Programs* as part of the *Program Finite State Machine*. These states represent the stages in which a *Program* can exist at an instance in time as viewed by a client. This state is the *Program's Current State*. All *Programs* must support this base set. A *Program* may or may not require a client action to cause the state to change.

**Table 2 - Program States**

State	Description
<b>Ready</b>	The <i>Program</i> is properly initialized and may be started.
<b>Running</b>	The <i>Program</i> is executing making progress towards completion.
<b>Suspended</b>	The <i>Program</i> has been stopped prior to reaching a terminal state but may be resumed.
<b>Halted</b>	The <i>Program</i> is in a terminal or failed state, and it cannot be started or resumed without being reset.

The set of states defined to describe a *Program* can be expanded. Program sub states can be defined for the base states to provide more resolution to the process and to describe the cause and effects of additional stimuli and transitions. Standards bodies and industry groups may extend the base *Program Finite State Model* to conform to industry models. For example, the Halted state can include the sub states “Aborted” and “Completed” to indicate if the function achieved a successful conclusion prior to the transition to Halted. Transitional states such as “Starting” or “Suspending” might also be extensions of the running state, for example.

#### 4.2.4 State Transitions

A standard set of state transitions is defined for the *Program Finite State Machine*. These transitions define the valid changes to the *Program’s* current state in terms of an initial state and a resultant state.

**Table 3 - Program State Transitions**

Transition No.	Transition Name	Initial State	Resultant State
1	HaltedToReady	Halted	Ready
2	ReadyToRunning	Ready	Running
3	RunningToHalted	Running	Halted
4	RunningToReady	Running	Ready
5	RunningToSuspended	Running	Suspended
6	SuspendedToRunning	Suspended	Running
7	SuspendedToHalted	Suspended	Halted
8	SuspendedToReady	Suspended	Ready
9	ReadyToHalted	Ready	Halted

#### 4.2.5 Program State Transition Stimuli

The stimuli or causes for a *Program’s* state transitions can be internal to the *Server* or external. Completion of machining steps, the detection of an alarm condition, or the transmission of a data packet are examples of internal stimuli. *Methods* are an example of external stimuli. Standard *Methods* are defined which act as stimuli for the control of a *Program*.

#### 4.2.6 Program Control Methods

*Clients* manage a *Program* by calling *Methods*. The *Methods* impact a *Program’s* behaviour by causing specified state transitions. The state transitions dictate the action’s performed by the *Program*. This specification defines a set of standard *Program Control Methods*. These *Methods* provide sufficient means for a client to run a *Program*.

Table 4 lists the set of defined *Program Control Methods*. Each *Method* causes transitions from specified states and must be called when the *Program* is in one of those states.

Individual *Programs* can optionally support any subset of the *Program Control Methods*. For example, some *Programs* may not be permitted to suspend and so would not provide the *Suspend* and *Resume Methods*.

*Programs* can support additional user defined *Methods*. User defined *Methods* must not change the behaviour of the base *Program Finite State Machine*.

**Table 4 - Program Control Methods**

Method Name	Description
Start	Causes the Program to transition from the Ready state to the Running state.
Suspend	Causes the Program to transition from the Running state to the Suspended state.
Resume	Causes the Program to transition from the Suspended state to the Running state.
Halt	Causes the Program to transition from the Ready, Running or Suspended state to the Halted state.
Reset	Causes the Program to transition from the Halted state to the Ready state.

*Program Control Methods* can include arguments that are used by the *Program*. For example, a Start method may include an options argument that specifies dynamic options used to determine some program behaviour. The arguments can differ on each *ProgramType*. The Method Call service specified in [UA Part 4] defines a return status. This return status indicates the success of the *Program Control Method* or a reason for its failure.

#### 4.2.7 Program State Transition Effects

A *Program's* state transition generally has a cause and also yields an effect. The effect is a by product of a *Program* state transition that can be used by a *Client* to monitor the progress of the *Program*. Effects can be internal or external. An external effect of a state transition is the generation of an event notification. Each *Program* state transition is associated with a unique event. These events reflect the progression and trajectory of the *Program* through its set of defined states. The internal effects of a state transition can be the performance of some programmatic action such as the generation of data.

#### 4.2.8 Program Result Data

##### 4.2.8.1 Overview

Result data is generated by a running *Program*. The result data can be intermediate or final. Result data may be associated with specific *Program* state transitions.

##### 4.2.8.2 Intermediate Result Data

Intermediate result data is transient and is generated by the *Program* in conjunction with non terminal state transitions. The data items that compose the intermediate results are defined in association with specific *Program* state transitions. Their values are relevant only at the transition.

Each *Program* state transition can be associated with different result data items. Alternately, a set of transitions can share a result data item. Percentage complete is an example of intermediate result data. The value of percentage complete is produced when the state transition occurs and is available to the client.

Clients acquire intermediate result data by subscribing to *Program* state transition events. The events specify the data items for each transition. When the transition occurs, the generated event conveys the result data values captured to the subscribed clients. If no *Client* is monitoring the *Program*, intermediate result data may be discarded.

##### 4.2.8.3 Terminal Result Data

Terminal result data is the final data generated by the *Program* as it ceases execution. Total execution time, number of widgets produced, and fault condition encountered are examples of terminal result data. When the *Program* enters the terminal state, this result data can be conveyed to the client by the transition event. Terminal result data is also available within the *Program* to be read by a client after the program stops. This data persists until the program instance is rerun or deleted.

#### 4.2.8.4 Monitoring Programs

*Clients* can monitor the activities associated with a *Program's* execution. These activities include the invocation of the management methods, the generation of result data, and the progression of the *Program* through its states. Audit Events are provided for *Method Calls* and state transitions. These events allow a record to be maintained of the clients that interacted with any *Program* and the *Program* state transitions that resulted from that interaction.

#### 4.2.9 Program Lifetime

##### 4.2.9.1 Overview

*Programs* can have different lifetimes. Some programs may always be present on a *Server* while others are created and removed. Creation and removal can be controlled by a *Client* or may be restricted to local means.

A *Program* can be *Client* creatable. If a *Program* is client creatable, then the *Client* can add the *Program* to the server. The *Object Create Method* defined in [UA Part 3] is used to create the *Program* Instance. The initial state of the *Program* can be *Halted* or *Ready*. Some *Programs*, for example, may require that a resource becomes available after its creation, before it is ready to run. In this case, it would be initialized in the *Halted* state and transition to *Ready* when the resource is delivered.

A *Program* can be *Client* removable. If the *Program* is client removable, then the *Client* can delete the *Program* Instance from the *Server*. The *Object DeleteNode Service* defined in [UA Part 4] is used to remove the *Program* Instance. The *Program* must be in a *Halted* state to be removed. A *Program* may also be auto removable. An auto removable *Program* deletes itself when execution has terminated.

##### 4.2.9.2 Program Instances

*Programs* can be multiple instanced or single instanced. A *Server* can support multiple instances of a *Program* if these *Program* instances can be run in parallel. For example, the *Program* may define a *Start Method* that has an input argument to specify which resource is acted upon by its functions. Each instance of the *Program* is then started designating use of different resources. The *Client* can discover all instances of a *Program* that are running on a *Server*. Each instance of a *Program* is uniquely identified on the *Server* and is managed independently by the *Client*.

##### 4.2.9.3 Program Recycling

*Programs* can be run once or run multiple times (recycled). A program that is run once will remain in the *Halted state* indefinitely once it has run. The normal course of action would be to delete it following the inspection of its terminal results.

Recyclable *Programs* may have a limited or unlimited cycle count. These *Programs* may require a reset step to transition from the *Halted* state to the *Ready* state. This allows for replenishing resources or reinitializing parameters prior to restarting the *Program*. The *Program Control Method* "Reset" triggers this state transition and any associated actions or effects.

## 5 Model

### 5.1 General

The *Program* Model extends the *StateMachineType* and basic *ObjectType* Models presented in [UA Part 5]. Each *Program* has a type definition that is the subtype of the *StateMachineType*. The *ProgramType* describes the *Finite State Machine* model supported by any *Program Invocation* of that type. The *ProgramType* also defines the property set that characterize specific aspects of that *Program's* behaviour such as lifetime and recycling as well as specifying the result data that is produced by the *Program*.

**Figure 4 - Program Type**

The base *ProgramType* defines the standard *Finite State Machine* specified for all *Programs*. This includes the states, transitions, transition causes (*Methods*) and effects (*Events*). Subtypes of the base *ProgramType* can be defined to extend or more specifically characterize the behaviour of an individual *Program* as illustrated with “*MyProgramType*” in Figure 4.

## 5.2 ProgramType

### 5.2.1 Overview

The additional properties and components that compose the *ProgramType* are listed in Table 5. No *ProgramType* specific semantics are assigned to the other base *ObjectType* or *StateMachineType* *Attributes* or *Properties*.

**Table 5 - ProgramType**

Attribute	Value

### 5.2.2 ProgramType Properties

The *Creatable Property* is a Boolean that specifies if *Program Invocations* of this *ProgramType* can be created by an OPC Client. If False, these *Program Invocations* are persistent or may only be created by the server.

The *Deletable Property* is a Boolean that specifies if a *Program Invocation* of this *ProgramType* can be deleted by an OPC Client. If False, these *Program Invocations* can only be deleted by the server.

The *AutoDelete Property* is a Boolean that specifies if *Program Invocations* of this *ProgramType* are removed by the *Server* when execution terminates. If False, these *Program Invocations* persist on the server until they are deleted by the *Client*. When the *Program Invocation* is deleted, any result data associated with the instance is also removed.

The *RecycleCount Property* is an unsigned integer that specifies the number of times a *Program Invocation* of this type has been recycled or restarted from its starting point (not resumed). Note: The *Reset Method* may be required to prepare a *Program* to be restarted.

The *MaxRecycleCount Property* is an integer that specifies the maximum number of times a *Program Invocation* of this type can be recycled or restarted from its starting point (not resumed). If the value is less than 0, there is no limit to the number of restarts. If the value is zero, the Program may not be recycled or restarted.

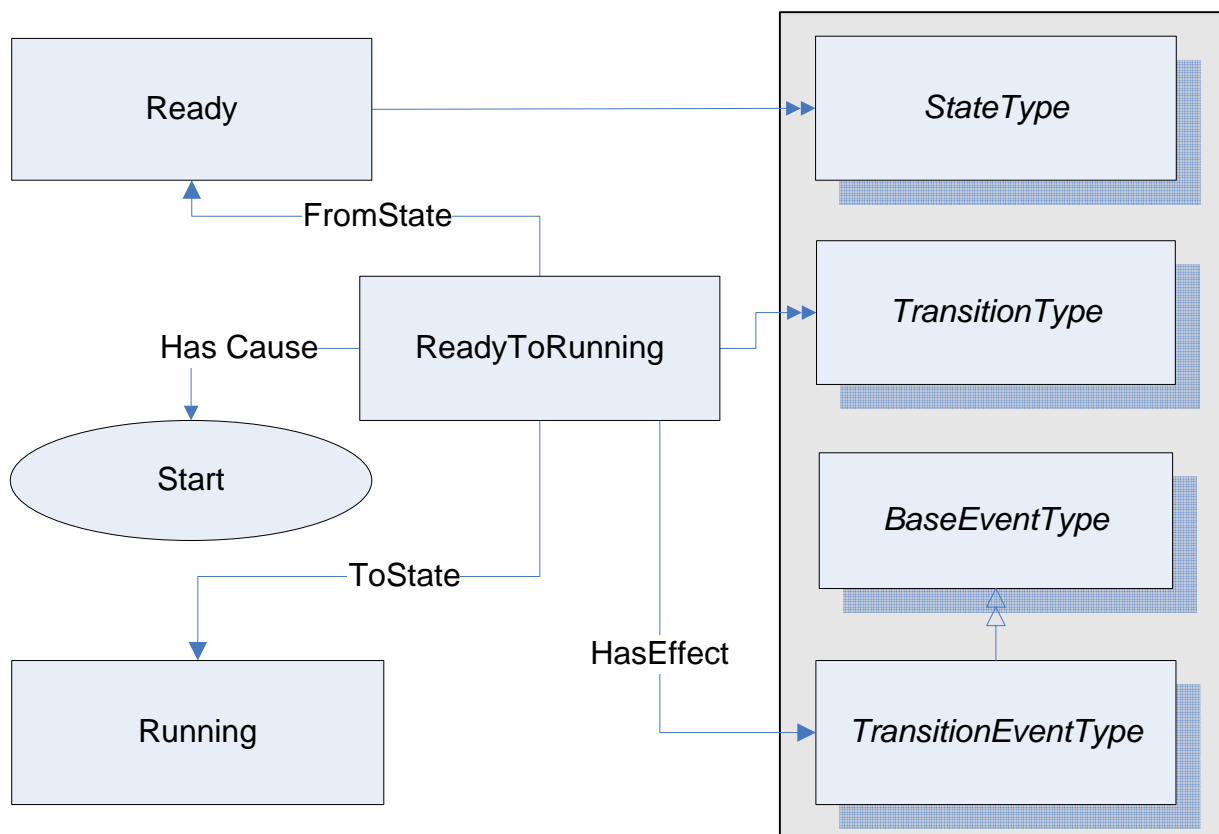

The *InstanceCount Property* is an unsigned integer that specifies the number of *Program Invocations* of this type that currently exist.

The *MaxInstanceCount Property* is an integer that specifies the maximum number of *Program Invocations* of this type that can exist simultaneously on this Server. If the value is less than 0, there is no limit.

### 5.2.3 ProgramType Components

#### 5.2.3.1 Overview

The *ProgramType Components* consists of a set of references to the object instances of *StateTypes*, *TransitionTypes*, *EventTypes* and the *Methods* that collectively define the *Program FiniteStateMachine*.

**Figure 5 - Program FSM References**

Figure 5 illustrates the *Component References* that define the associations between two of the *ProgramType*'s states, *Ready* and *Running*. The complementary *ReferenceTypes* have been omitted to simplify the illustration.

#### 5.2.3.2 ProgramType States

Table 6 specifies the *ProgramType*'s *State Objects*. These *State Objects* are instances of the *StateType* defined in [UA Part 5] - SM Appendix. Each *State* is assigned a unique *StateNumber* value. Subtypes of the *ProgramType* can add references from any state to a subordinate or nested *StateMachine Object* to extend the *FiniteStateMachine*.

**Table 6 - Program States**

BrowseName	References	Target BrowseName	Value	Target TypeDefinition	Notes

	ToTransition	RunningToSuspended		TransitionType	
	FromTransition	ReadyToRunning		TransitionType	
	FromTransition	SuspendedToRunning		TransitionType	
Suspended	HasProperty	StateNumber	4	PropertyType	
	ToTransition	SuspendedToRunning		TransitionType	
	ToTransition	SuspendedToHalted		TransitionType	
	ToTransition	SuspendedToReady		TransitionType	
	FromTransition	RunningToSuspended		TransitionType	

The *Halted* state is the idle state for a *Program*. It can be an initial state or a terminal state. As an initial state, the Program Invocation can not yet begin execution due to conditions at the server. As a terminal state, *Halted* can indicate either a failed or completed *Program*. A subordinate state or result can be used to distinguish the nature of the termination. The *Halted* state references four *Transition Objects*, which identify the allowed state transitions to the *Ready* state and from the *Ready*, *Running*, and *Suspended* States.

The *Ready* state indicates that the *Program* is prepared begin execution. *Programs* that are ready to begin upon their creation may transition immediately to the *Ready* State. The *Ready* state references four *Transition Objects*, which identify the allowed state transitions to the *Running* and *Halted* states and from the *Halted* and *Ready* states.

The *Running* state indicates that the *Program* is actively performing its function. The *Ready* state references five *Transition Objects*, which identify the allowed state transitions to the *Halted*, *Ready*, and *Suspended* states and from the *Ready* and *Suspended* States.

The *Suspended* state indicates that the *Program* has stopped performing its function, but retains the ability to resume the function at the point at which it was executing when suspended. The *Suspended* state references four *Transition Objects*, which identify the allowed state transitions to the *Ready* state and from the *Ready*, *Running*, and *Suspended* States.

#### 5.2.3.2.1 Program Initial State

The initial state of a *ProgramType* is the state that the Program Invocation assumes upon creation. This *State* is formally specified in the *Program Finite State Machine* by defining an *InitialState Reference* in the *ProgramType*. The *InitialState Reference Type* is defined in [UA Part 5] - SM Appendix. If specified, the target of the *InitialState Reference* must be either the *Halted State* or the *Ready State*. In some *Programs*, the initial state can vary and would not be referenced. If these *Halted* or *Ready States* contain subordinate *Finite State Machines*, the FSM can include an *InitialState* reference.

#### 5.2.3.3 ProgramType Transitions

*ProgramType* Transitions are instances of *Objects* of the *TransitionType* defined in [UA Part 5] - SM Appendix which also includes the definitions of the *ToState*, *FromState*, *HasCause*, and *HasEffect* references used. Table 7 specifies the Transitions defined for the *ProgramType*. Each Transition is assigned a unique *TransitionNumber*.

**Table 7 - Program Transitions**

BrowseName	References	Target BrowseName	Value	Target TypeDefinition	Notes
<b>Transitions</b>					
HaltedToReady	HasProperty	TransitionNumber	1	PropertyType

	HasEffect	ProgramTransitionEventType			
	HasEffect	ProgramTransitionAuditEventType			Optional
SuspendedToHalted	HasProperty	TransitionNumber	7	PropertyType	
	ToState	Halted		StateType	
	FromState	Suspended		StateType	
	HasCause	Halt			Method
	HasEffect	ProgramTransitionEventType			
	HasEffect	ProgramTransitionAuditEventType			Optional
SuspendedToReady	HasProperty	TransitionNumber	8	PropertyType	
	ToState	Ready		StateType	
	FromState	Suspended		StateType	
	HasCause	Reset			Method
	HasEffect	ProgramTransitionEventType			
	HasEffect	ProgramTransitionAuditEventType			Optional
ReadyToHalted	HasProperty	TransitionNumber	9	PropertyType	
	ToState	Halted		StateType	
	FromState	Ready		StateType	
	HasCause	Halt			Method
	HasEffect	ProgramTransitionEventType			
	HasEffect	ProgramTransitionAuditEventType			Optional

The *HaltedToReady* transition specifies the Transition from the *Halted* to *Ready* States. It may be caused by the *Reset Method*.

The *ReadyToRunning* transition specifies the Transition from the *Ready* to *Running* States. It is caused by the *Start Method*.

The *RunningToHalted* transition specifies the Transition from the *Running* to *Halted* States. It is caused by the *Halt Method*.

The *RunningToReady* transition specifies the Transition from the *Running* to *Ready* States. The *RunningToSuspended* transition specifies the Transition from the *Running* to *Suspended* States. It is caused by the *Suspend Method*. When this transition occurs,

The *SuspendedToRunning* transition specifies the Transition from the *Suspended* to *Running* States. It is caused by the *Resume Method*.

The *SuspendedToHalted* transition specifies the Transition from the *Suspended* to *Halted* States. It is caused by the *Halt Method*.

The *SuspendedToReady* transition specifies the Transition from the *Suspended* to *Ready* States. It is caused by the *Halt Method*.

The *ReadyToHalted* transition specifies the Transition from the *Ready* to *Halted* States. It is caused by the *Halt Method*.

Two *HasEffect* references are specified for each Program Transition. These effects are events of type *ProgramTransitionEventType* and *ProgramTransitionAuditEventType* defined in xxx. The *ProgramTransitionEventType* notifies *Clients* of the Program Transition and conveys result data. The *ProgramTransitionAuditEventType* can optionally be used to audit transitions that result from *Program Control Methods*.

Figure 6 - ProgramType Causes and Effects

## 5.2.4 ProgramType Causes (Methods)

### 5.2.4.1 Overview

The *ProgramType* includes references to the *Causes* of specific *Program* state transitions. These causes refer to *Method* instances. *Programs* that do not support a *Program Control Method*, omit the *Causes* reference to that *Method* from the *ProgramType* references. If a *Method's Causes* reference is omitted from the *ProgramType*, a *Client* cannot cause the associated state transition. The *Method* instances referenced by the *ProgramType* identify the *InputArguments* and *OutputArguments* required for the *Method* calls to *Program* Invocations of that *ProgramType*. Table 8 - *ProgramType Causes* specifies the *Methods defined as Causes for ProgramTypes*. Figure 6 - *ProgramType Causes and Effects* illustrates the references associating the components and properties of *Methods* and *Events* with *ProgramTransitions*.

**Table 8 - ProgramType Causes**

BrowseName	References	Target BrowseName	Value	Target TypeDefinition	Notes
<b>Causes</b>					
Start	HasProperty	InputArguments		PropertyType	Optional
	HasProperty	OutputArguments		PropertyType	Optional
Suspend	HasProperty	InputArguments		PropertyType	Optional
	HasProperty	OutputArguments		PropertyType	Optional
Resume	HasProperty	InputArguments		PropertyType	Optional
	HasProperty	OutputArguments		PropertyType	Optional
Halt	HasProperty	InputArguments		PropertyType	Optional
	HasProperty	OutputArguments		PropertyType	Optional
Reset	HasProperty	InputArguments		PropertyType	Optional
	HasProperty	OutputArguments		PropertyType	Optional

The *Start Method* causes the *ReadyToRunning Program* transition.

The *Suspend Method* causes the *RunningToSuspended Program* transition.

The *Resume Method* causes the *SuspendedToRunning Program* transition.

The *Halt Method* causes the *RunningToHalted*, *SuspendedToHalted*, or *ReadyToHalted Program* transition depending on the *CurrentState* of the *Program*.

The *Reset Method* causes the *HaltedToReady Program* transition.

#### 5.2.4.2 Standard Attributes

The *Executable Method* attribute indicates if a method can currently be executed. For *Program Control Methods*, this means that the owning *Program* has a *CurrentState* that supports the transition caused by the *Method*.

#### 5.2.4.3 Standard Properties

##### 5.2.4.3.1 Overview

*Methods* can reference a set of *InputArguments*. For each *ProgramType*, a set of *InputArguments* may be defined for the supported *Program Control Methods*. The data passed in the arguments supplements the information required by the *Program* to perform its function. All calls to a *Program Control Method* for each *Program Invocation* of that *ProgramType* must pass the specified arguments.

*Methods* can reference a set of *OutputArguments*. For each *ProgramType*, a set of *OutputArguments* is defined for the supported *Program Control Methods*. All calls to a *Program Control Method* for each *Program Invocation* of that *ProgramType* must pass the specified arguments.

#### 5.2.5 ProgramType Effects (Events)

##### 5.2.5.1 Overview

The *ProgramType* includes component references to the *Effects* of each of the *Program's* state transitions. These *Effects* are *Events*. Each *Transition* must have a *HasEffect* reference to a

*ProgramTransitionEventType* and can have a *ProgramTransitionAuditEventType*. When the transition occurs, event notifications of the referenced type are generated for subscribed *Clients*. The Program Invocation may serve as the *EventNotifier* for these events or an owning object or the *Server Object* may provide the notifications.

*ProgramTransitionEventTypes* provide the means for delivering result data and confirming state transitions for subscribed *Clients* on each defined *Program State Transition*. *ProgramTransitionAuditEventTypes* allows the auditing of changes to the *Program's State* in conjunction with auditing client *Method Calls*. .

### 5.2.5.2 ProgramTransitionEventType

The *ProgramTransitionEventType* is a subtype of the *TransitionEventType*. It is used with Programs to acquire intermediate or final results or other data associated with a state transition. A Program can have a unique *ProgramTransitionEventType* definition for any transition. Each *ProgramTransitionEventType* specifies the IntermediateResult data specific to the designated state transition on that program type. Each transition can yield different Intermediate result data. Table 9 specifies the *ProgramTransitionEventType*. Table 10 identifies the *ProgramTransitionEventTypes* that are specified for *ProgramTypes*.

**Table 9 - ProgramTransitionEventType**

Attribute	Value

HasComponent	Object	IntermediateResult		BaseObjectType	OptionalNew

The *TransitionNumber* property is a *Variable* that identifies the *Program Transition* that triggered the event.

The *FromStateNumber* property is a *Variable* that is the *StateNumber* of the originating state of the *Program Transition*.

The *ToStateNumber* property is a *Variable* that is the *StateNumber* of the terminal state in The *Program Transition*.

The *IntermediateResult* is an object that aggregates a set of variables whose values are relevant for the Program at the instant of the associated transition. The *ObjectType* for the *IntermediateResult* specifies the collection of variables using a set of *HasComponent* references.

**Table 10 – ProgramTransitionEvents**

	HasProperty	TransitionNumber	9	PropertyType	
	HasProperty	FromStateNumber	2	PropertyType	
	HasProperty	ToStateNumber	1	PropertyType	
	HasComponent	IntermediateResults		ObjectType	Optional

### 5.2.6 ProgramTransitionAuditEventType

The *ProgramTransitionAuditEventType* is a subtype of the *AuditEventType*. This *EventType* inherits all *Properties* of the *AuditEventType* defined in [UA- Part 5]. It is used with *Programs* to provide a means to audit the *Program State Transitions* associated with any *Client* invoked *Program Control Method*. Table 11 specifies the definition of the *ProgramTransitionAuditEventType*

**Table 11 - ProgramTransitionAuditEvent**

Attribute	Value				
BrowseName	ProgramTransitionAuditEventType				
IsAbstract	True				
References	NodeClass	BrowseName	Data Type	TypeDefinition	ModellingRule
Inherits the <i>Properties</i> of the <i>AuditEventType</i> defined in [UA- Part 5]					
HasProperty	Variable	TransitionNumber	UInt32	PropertyType	New

The *Status Property*, specified in [UA- Part 5] *AuditEventType*, identifies whether the state transition resulted from a Program Control Method call (set *Status* to TRUE) or not (set *Status* to FALSE).

The *ClientUserId Property*, specified in [UA- Part 5] *AuditEventType*, identifies the user of the *Client* that issued the *Program Control Method* if it is associated with this *Program State Transition*.

The *ActionTimeStamp Property*, specified in [UA- Part 5] *AuditEventType*, identifies when the time the *Program State Transition* that resulted in the event being generated occurred.

The *TransitionNumber* property is a *Variable* that identifies the Transition that triggered the event.

### 5.2.7 FinalResultData

The *FinalResultData ObjectType* specifies the *VariableTypes* that are preserved when the *Program* has completed its function. The *ObjectType* includes a *HasComponent* for a *VariableType* of each variable that comprises the *FinalResultData*. The values of the Variables

### 5.2.8 ProgramDiagnosticType

#### 5.2.8.1 Overview

The *ProgramDiagnosticType* provides information that can be used to aid in the diagnosis of *Program* problems. This object contains a collection of *Variables* that chronicle the *ProgramInvocation's* activity. Table 12 specifies the *Variables that compose the ProgramDiagnosticType*.

**Table 12 - ProgramDiagnosticType**

Attribute	Value			
BrowseName	ProgramDiagnosticsType			
IsAbstract	False			
References	NodeClass	BrowseName	Data Type / TypeDefinition	Modelling Rule
Subtype of the <i>BaseObjectType</i> defined in [UA Part 5].				
HasComponent	Variable	CreateSessionId	Int32	New
HasComponent	Variable	CreateClientName	String	New
HasComponent	Variable	InvocationCreationTime	UTCTime	New
HasComponent	Variable	LastTransitionTime	UTCTime	New
HasComponent	Variable	LastMethodCall	String	New
HasComponent	Variable	LastMethodSessionId	Int32	New
HasComponent	Variable	LastMethodInputArguments	InputArguments	New
HasComponent	Variable	LastMethodOutputArguments	OutputArguments	New
HasComponent	Variable	LastMethodCallTime	UTCTime	New
HasComponent	Variable	LastMethodReturnStatus	returnStatus	New

The *CreateSessionId* contains the *SessionId* of the session on which the call to the *Create Service* was issued to create the Program Invocation.

The *CreateClientName* is the name of the client of the session that created the *Program Invocation*.

The *InvocationCreationTime* identifies the time the *Program Invocation* was created.

The *LastTransitionTime* identifies the time of the last program state transition that occurred.

The *LastMethodCall* identifies the last *Program Method* called on the *Program Invocation*.

The *LastMethodSessionId* contains the *SessionId* of the session on which the last Program Control Method call to the *Program Invocation* was issued.

The *LastMethodClientName* is the name of the client of the session that made the last Method call to the *Program Invocation*.

The *LastMethodInputArguments* preserves the values of the input arguments on the last *Program Method* call.

The *LastMethodOutputArguments* preserves the values of the output arguments on the last *Program Method* call.

The *LastMethodCallTime* identifies the time of the last Method call to the *Program Invocation*.

The *LastMethodReturnStatus* preserves the value of the *returnStatus* for the last Program Control Method requested for this *Program Invocation*.

## Annex A - Program Example

### A.1 Overview

This example illustrates the use of a UA *Program* to manage a domain download into a control system as depicted in Figure 7. The download requires the segmented transfer of control operation data from a secondary storage device to the local memory within a control system.

Figure 7 - Program Example 1

The Domain Download has a source and a target location which are identified when the download is initiated. Each time a segment of the domain is successfully transferred, the client is notified and informed of the amount of data that has been downloaded. The client is also notified when the download is finished. The percentage of the total data received is reported periodically while the download continues. If the download fails, the cause of the failure is reported. At the completion of the download, performance information is persisted at the UA Server.

### A.2 DomainDownload Program

The UA Client uses the “**DomainDownload**” Program to manage and monitor the download of a domain at the UA Server.

#### A.2.1 DomainDownload States

The basic state model for the DomainDownload Program is presented in **Figure 8**. The Program has three primary states, *Ready*, *Running*, and *Halted* which are aligned with the standard states of a ProgramType. Additionally, the DomainDownloadType extends the UA ProgramType by defining subordinate state machines for the Program’s *Running* and *Halted* States. The subordinate states

describe the download operations in greater detail and allow the *UA Client* to monitor the activity of the download at a finer resolution.

An instance (Program Invocation) of a *DownloadDomain Program* is created by the client each time a download is to be performed. The instance exists until explicitly removed by the client. The initial state of the *Program* is *Ready* and the terminal state is *Halted*. The *DomainDownload* can be temporarily suspended and then resumed or aborted. Once halted, the program may not be restarted.

**Error! Objects cannot be created from editing field codes.**

**Figure 8 – DomainDownload State Diagram**

**Figure 8** illustrates the sequence of state transitions. Once the download is started, The *Program* progresses to the *Opening* state. After the source of the data is opened, a sequence of transfers occurs in the *Sending* state. When the transfer completes the objects are closed in the *Closing* State. If the transfer is terminated before all of the data is downloaded or an error is encountered, the download is halted, and the *Program* transitions to the *Aborted* state, otherwise the programs halts in the *Completed* state. The states are presented in Table 13 along with the state transitions.

### A.2.2 DomainDownload Transitions

The valid state transitions specified for the *DomainDownload Program* and are specified in Table 13. Each of the transitions defines a start state and end state for the transition and is identified by a unique number. Five of the transitions are from the base *ProgramType* and retain the transition identifier numbers specified for *Programs*. The additional transitions relate the base program states with the subordinate states defined for the *DomainDownload*. These states have been assigned unique transition identifier numbers distinct from the base *Program* transition identifiers. In cases where transitions occur between substates and the *Program's* base states, two transitions are specified. One transition identifies the base state change and a second the sub-state change. For example, *Ready* to *Running* and to *Opening* occurs at the same time.

The table also specifies the defined states, causes for the transitions, and the effects of each transition. *Program Control Methods* are used by the *UA Client* to “run” the *DomainDownload*. The *Methods* cause or trigger the specified transitions. The transition effects are the specified *EventTypes* which notify the client of *Program* activity.

**Table 13 - DomainDownload States**

No.	Transition Name	Cause	From State	To State	Effect
2	ReadyToRunning	Start Method	Ready	Running	Report Transition 2 Event/Result
3	RunningToHalted	Halt Method/Error or Internal.	Running	Halted	Report Transition 3 Event/Result
5	RunningToSuspended	Suspend Method	Running	Suspended	Report Transition 5 Event/Result

17	ToOpening	Internal	Ready	Opening	Report Transition 19 Event/Result

### A.2.3 DomainDownload Methods

Four standard *Program Methods* are specified for running the *DomainDownload Program*, *Start*, *Suspend*, *Resume*, and *Halt*. No additional *Methods* are specified. The base behaviours of these methods are defined by the *ProgramType*. The *Start Method* initiates the download activity and

passes the source and destination locations for the transfer. The *Suspend Method* is used to pause the activity temporarily. The *Resume Method* reinitiates the download, when paused. The *Halt Method* aborts the download. Each of the methods causes a *Program* state transition and a sub state transition. The specific state transition depends on the current state at the time the *Method* is called. If a *Method Call* is made when the *DomainDownload* is in a state for which that *Method* has no associated transition, the *Method* returns an error status indicating invalid state for the method.

#### A.2.3.1 Method Arguments

The *Start Method* specifies three input arguments to be passed when it is called; Domain Name, DomainSource, and DomainDestination. The other *Methods* require no input arguments. No output arguments are specified for the *DomainDownload* methods. The resultant error status for the *Program* is part of the *Call* service.

#### A.2.4 DomainDownload Events

A *ProgramTransitionEventType* is specified for each of the *DomainDownload Program* transitions. The event types trigger a specific event notification to the *UA Client* when the associated state transition occurs in the running *Program* instance. The event notification identifies the transition. The *SendingToSending* state transition also includes intermediate result data.

##### A.2.4.1 Event Information

The *SendingToSending* program transition event relays intermediate result data to the *UA Client* along with the notification. Each time the transition occurs, data items describing the amount and percentage of data transferred is sent to the *UA Client*.

##### A.2.4.2 Final Result Data

The *DomainDownload Program* retains final result data following a completed or aborted download. The data includes the total transaction time and the size of the domain. In the event of an aborted download, the reason for the termination is retained.

#### A.2.5 DomainDownload Model

##### A.2.5.1 Overview

The *UA Model* for the *DomainDownload.Program* is presented in the following tables and figures. Collectively they define the components that constitute this program. For clarity, the figures present a progression of portions of the model that complement the contents of the tables and illustrate the *Program's* composition.

The type definition for the *DomainDownload Program* precisely represents the behaviour of the program in terms of *UA* components. These components can be browsed by a *UA Client* to interpret or validate the actions of the *Program*.

##### A.2.5.2 DomainDownloadType

The *DomainDownloadType* is a subtype derived from the *UA ProgramType*. It specifies the use or non-use of optional *ProgramType* components, valid extensions such as subordinate state machines, and constrained attribute values applied to instances of *DomainDownload Programs*.

Table 14 specifies the optional and extended components defined by the *DomainDownload Type*. Note the references to two sub *State Machine Types*, *TransferStateMachine* and *FinishStateMachine*. The *DomainDownloadType* omits references to the *Reset Program Control Method* and its associated state transition (*HaltedToReady*), which it does not support.

Figure 9 illustrates the components of *DomainDownloadType* and its instance, including their ownership and derivation. Transitions and *EventTypes* are represented by their numeric Identifiers

in the figure. The references that exist between *StatesTypes*, *TransitionTypes*, *EventNotificationTypes*, and *Methods* are not shown in Figure 9.

Figure 15 specifies the *StateTypes* associated with the Transfer State Machine Type. All of these states are sub states of the *Running* state of the base *ProgramType*.

The Opening *State* is the preparation state for the domain download.

The Sending *State* is the activity state for the transfer in which the data is moved from the source to destination.

The Closing *State* is the cleanup phase of the download.

A *DomainDownload Program Invocation* can be created and also destroyed by a *UA Client*. The *Program Invocation* will not delete itself when halted, but will persist until explicitly removed by the *UA Client*. A *DomainDownload Program Invocation* can not be reset to restart. The *UA Server* will support up to 500 concurrent *DomainDownload Program Invocations*.

Figure 9 presents a partial DomainDownloadType model that illustrates the association between the states and the DomainDownload, Transfer, and Finish state machines. Note that the current state number for the sub state machines is only valid when the DomainDownload active base state references the sub state machine, Running for the Transfer current state and Halted for the Finish current state.

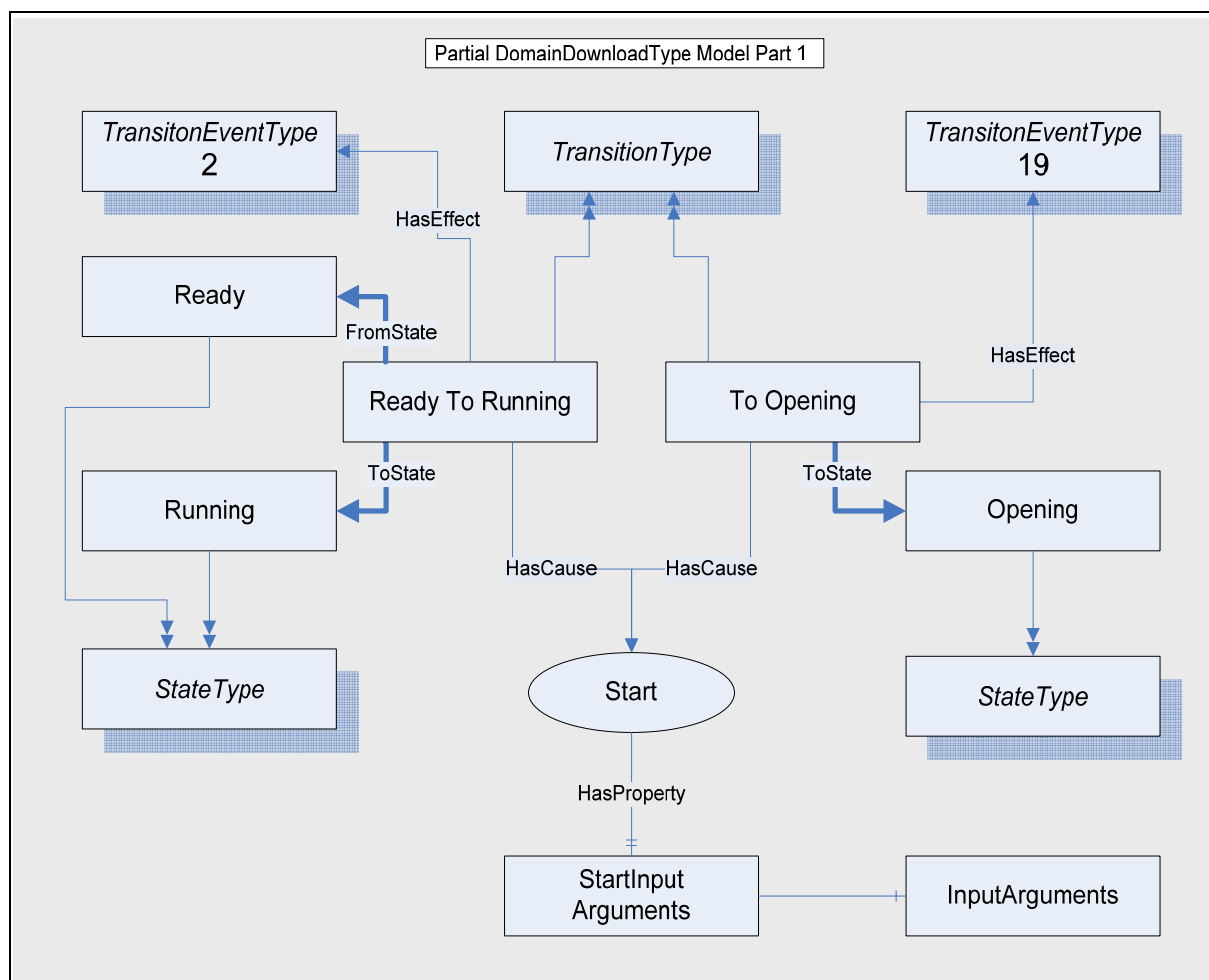

Figure 9 - DomainDownloadType Partial State Model

Table 20 specifies the *ProgramTransitionTypes* that are defined in addition to the Standard *UA ProgramTransitonTypes* specified for *Programs* in Table 7. These types associate the Transfer and Finish sub state machine states with the states of the base *Program*.

**Table 20 - Additonal DomainDownload Transition Types**

BrowseName	References	Target BrowseName	Value	Target TypeDefinition	Notes
<b>Transitions</b>					
ToSending	HasProperty	TransitionNumber	10	PropertyType

	HasEffect	ProgramTransitionAuditEventType			Optional

Figure 10 Through **Figure 16** illustrate portions of the DomainDownloadType model. In each figure, the referenced States, Methods, Transitions and EventTypes are identified for one or two state transitions.

**Figure 10 – Ready To Running Model**

Figure 10 illustrates the model for the ReadyToRunning Program Transition. The transition is caused by the Start Method. The Start Method requires three input arguments. The Method *Call* service is used by the *UA Client* to invoke the *Start Method* and pass the arguments. When successful, the Program Invocation enters the Running State and the subordinate Transfer Opening State. The *UA Server* issues two event notifications, ReadyToRunning (2) and ToOpening (19).

**Table 21 - Start Method Additions**

Attribute	Value				
BrowseName	Start				
IsAbstract	False				
References	NodeClass	BrowseName	DataType	TypeDefinition	ModellingRule
HasProperty	Variable	InputArgument	Argument[]	PropertyType	--

Table 21 specifies that the Start Method for the DomainDownloadType requires input arguments. Table 22 identifies the Start Arguments required.

**Table 22 - StartArguments**

Name	Type	Value
Argument 1	structure	
name	String	SourcePath
dataType	NodeId	StringNodeId
arraySize	Int32	-1
description	LocalizedText	The source specifier for the domain.
Argument 2	structure	
Name	String	DesinationPath
dataType	NodeId	StringNodeId
arraySize	Int32	-1
description	LocalizedText	The destination specifier for the domain.
Argument 3	structure	
name	String	DomainName
dataType	NodeId	StringNodeId
arraySize	Int32	-1
description	LocalizedText	The name of the domain.

Figure 11 illustrates the model for the Opening To Sending and the Sending to Closing Program Transitions. As specified in the transition table, these state transitions require no *Methods* to occur, but rather are driven by the internal actions of the server. Event notifiers are generated for each state transition (10-12), when they occur.

**Figure 11 - Opening To Sending To Closing Model**

Notice that a state transition can initiate and terminate at the same state (Sending). In this case the transition serves a purpose. The ProgramTransitionEventType effect referenced by the SendingToSending State Transition has an IntermediateResultData object reference. The

IntermediateResultData object serves to identify two variables whose values are obtained each time the state transition occurs. The values are sent to the *UA Client* with the event notification.

Table 24 identifies these variables as AmountTransferred and PercentageTransferred.

**Table 23 - Intermediate Results Object**

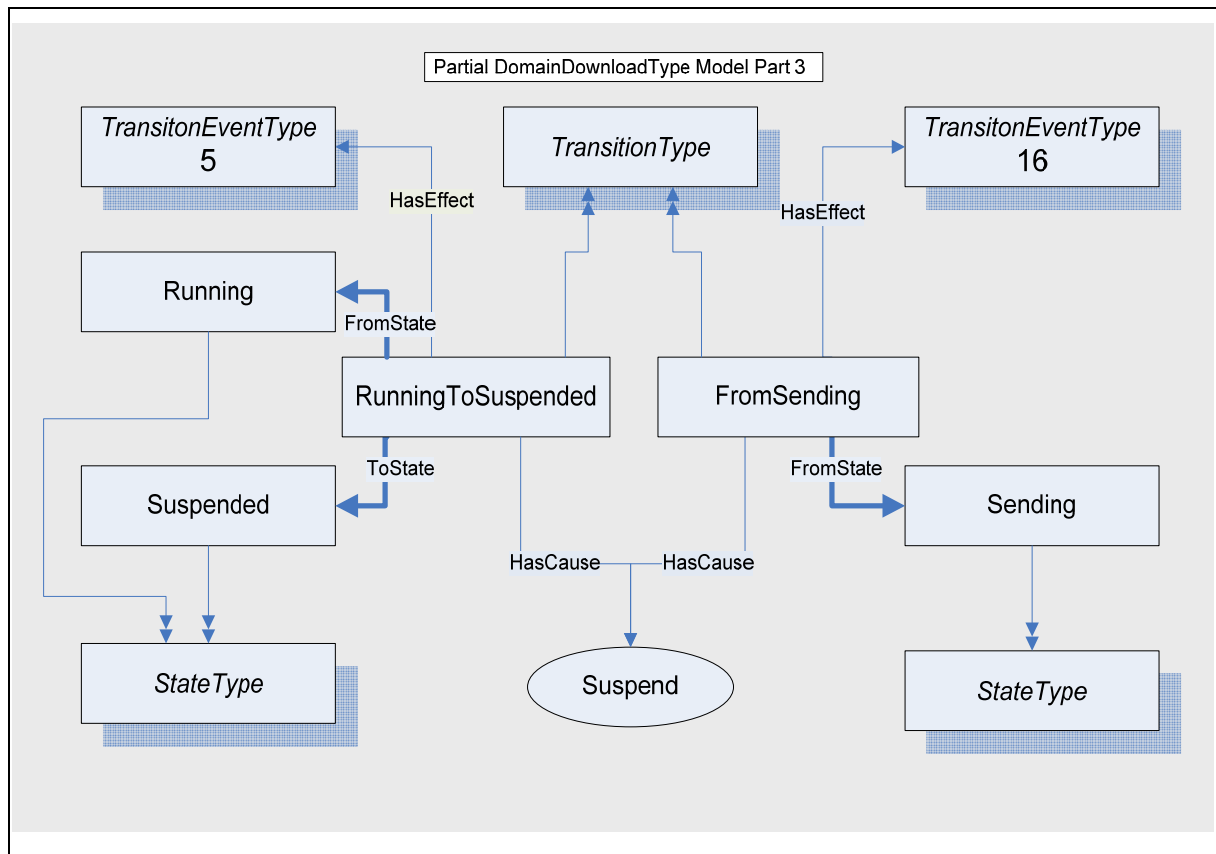

Attribute	Value				
	Includes all attributes specified for the ObjectType				
BrowseName	IntermediateResults				
IsAbstract	False				
References	NodeClass	BrowseName	Data Type	TypeDefinition	Modelling Rule
HasComponent	Variable	AmountTransferred	Long	VariableType	New
HasComponent	Variable	PercentageTransferred	Long	VariableType	New

**Table 24 - Immediate Result Data Variables**

Immediate Result Variables	Type	Value
Variable 1	Structure	
Name	String	AmountTransferred
dataType	NodeId	StringNodeId
description	LocalizedText	Bytes of domain data transferred.
Variable 2	Structure	
Name	String	PercentageTransferred
dataType	NodeId	StringNodeId
description	LocalizedText	Percentage of domain data transferred..

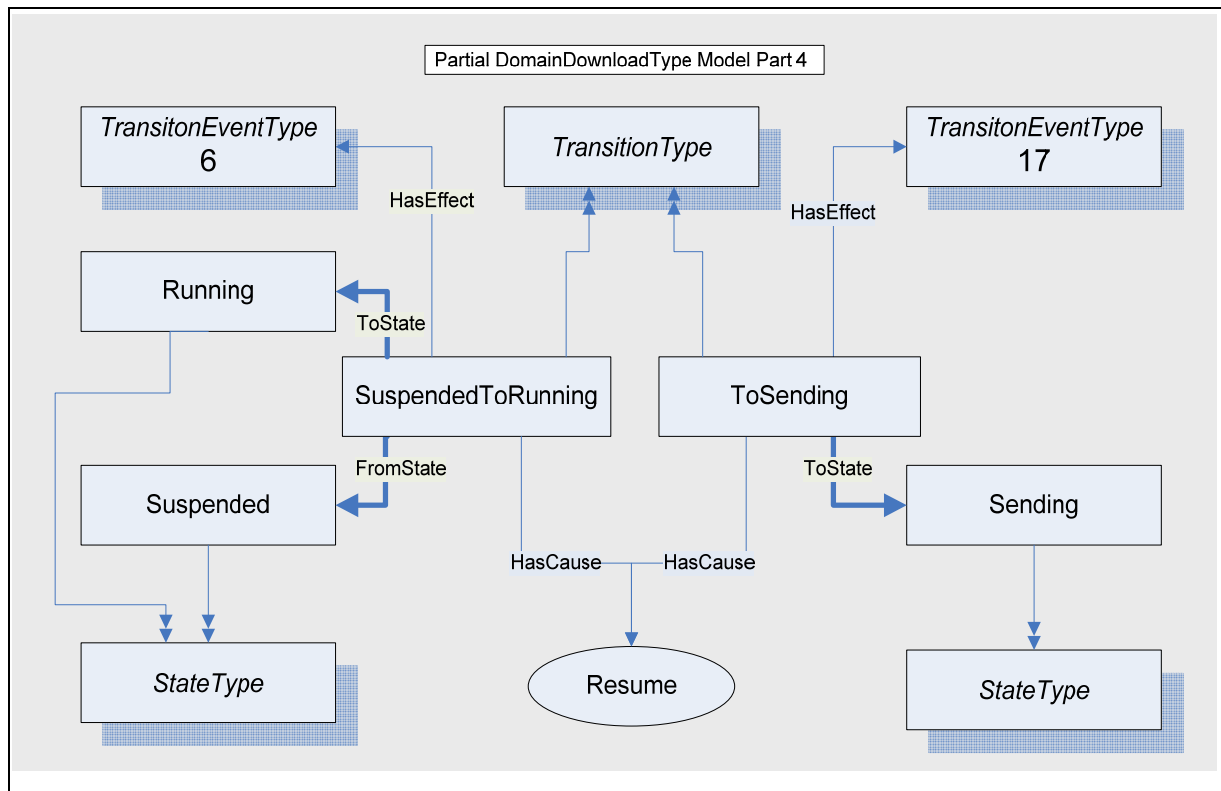

**Figure 12** Illustrates the model for the Running To Suspended state transition. The cause for this transition is the *Suspend Method*. The *UA Client* can pause the download of domain data to the control. The transition from Running to Suspended evokes the event notifiers for TransitionEventTypes 5 and 16. Note that there is no longer a valid current state for the Transfer State Machine.

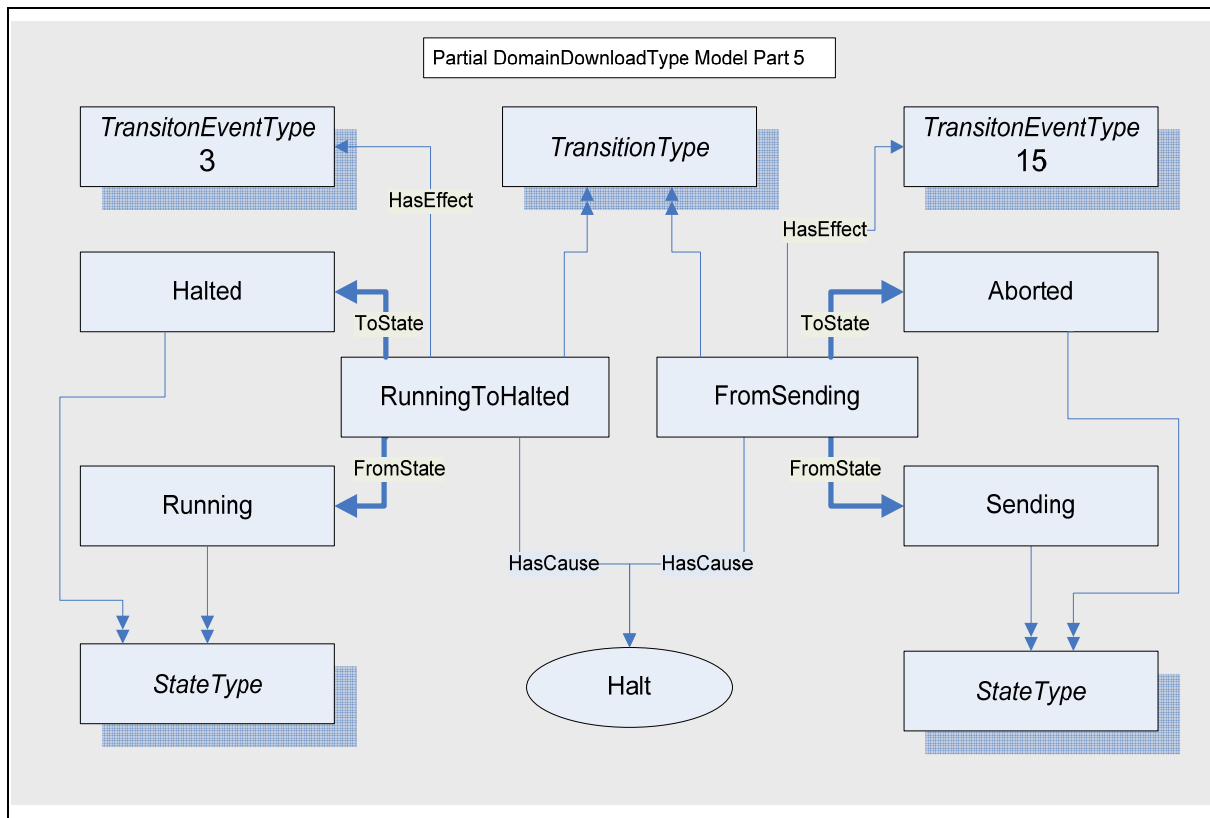

**Figure 12 - Running To Suspended Model**

**Figure 13** illustrates the model for the Suspended To Running state transition. The cause for this transition is the *Resume Method*. The *UA Client* can resume the download of domain data to the control. The transition from Suspended to Running evokes the event notifiers for TransitionEventTypes 6 and 17. Now that the Running state is active, the Sending State of the Transfer State Machine is again specified for the CurrentStateNumber.

**Figure 13 - Suspended To Running Model**

**Figure 14** illustrates the model for the Running To Halted state transition for an abnormal termination of the domain download. The cause for this transition is the *Halt Method*. The *UA Client* can terminate the download of domain data to the control. The transition from Running To Halted evokes the event notifiers for TransitionEventTypes 3 and 15. The TransitionEventType 15 indicates the transition from the Sending State as the Running State is exited and to the Aborted State as the Halted State is entered.

**Figure 14 - Running To Halted - Aborted Model**

Figure 15 illustrates the model for the Suspended To Halted state transition for an abnormal termination of the domain download. The cause for this transition is the *Halt Method*. The *UA Client* can terminate the download of domain data to the control while it is suspended. The transition from Suspended To Halted evokes the event notifiers for TransitionEventTypes 7 and 18.

Figure 15 - Suspended To Aborted Model

**Figure 16** illustrates the model for the Running To Completed state transition for a normal termination of the domain download. The cause for this transition is internal. The transition from Closing To Halted evokes the event notifiers for TransitionEventTypes 3 and 14. The TransitionEventType 14 indicates the transition from the Closing State as the Running State is exited and to the Completed State as the Halted State is entered.

The DomainDownloadType includes a component reference to a FinalResultData object. This object references variables that persists information about the domain download once it has completed. This data can be read by UA Clients who are not subscribed to event notifications.

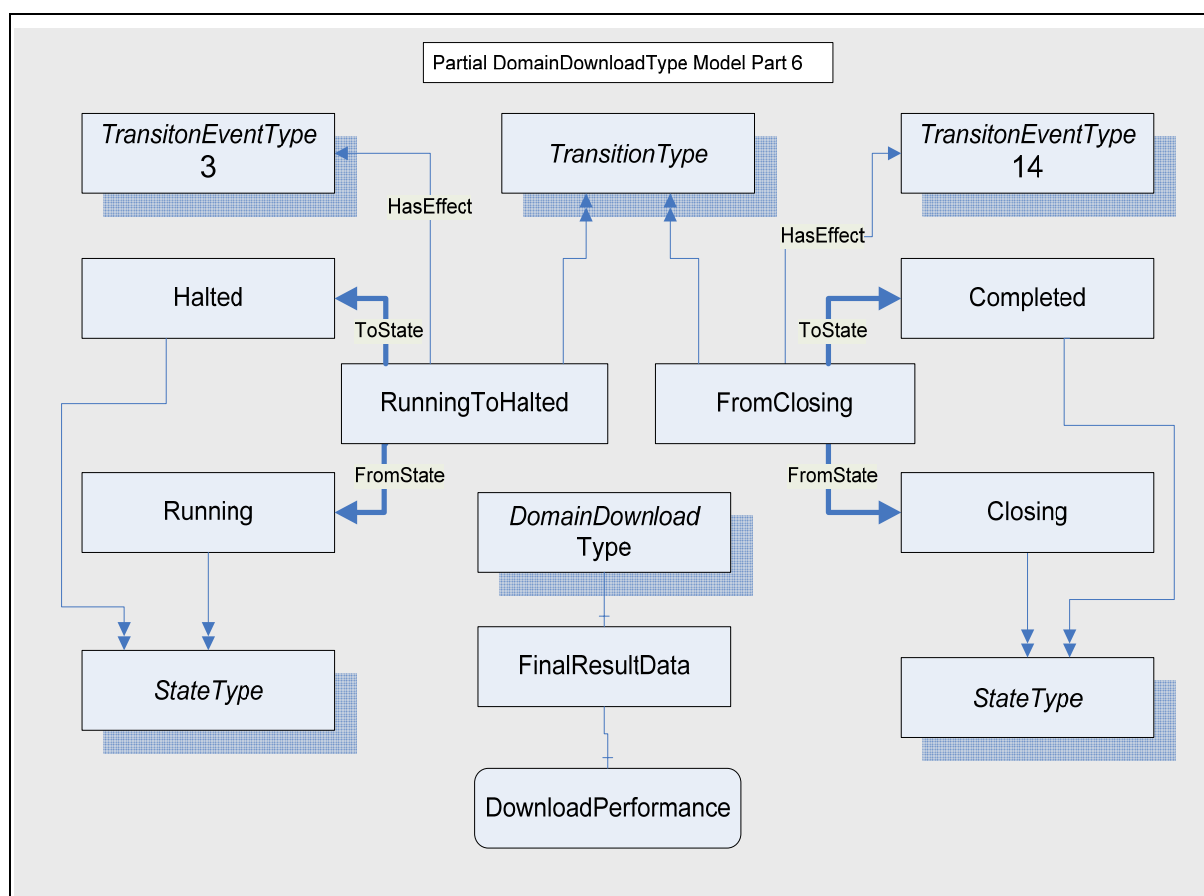

Table 25 - Final Result Data

Attribute	Value				
	Includes all attributes specified for the ObjectType				
BrowseName	FinalResultData				
IsAbstract	False				
References	NodeClass	BrowseName	Data Type	TypeDefinition	Modelling Rule
HasComponent	Variable	DownloadPerformance	Long	VariableType	New
HasComponent	Variable	FailureDetails	Long	VariableType	New

The Domain Download net transfer data rate and detailed reason for aborted downloads is retained as final result data for each Program Invocation.

**Table 26 - Final Result Variables**

Final Result Variables	Type	Value
Variable 1	Structure	
Name	String	DownloadPerformance
dataType	NodeId	Double
description	LocalizedText	Data rate for domain data transferred.
Variable 2	Structure	
Name	String	FailureDetails
dataType	NodeId	StringNodeId
description	LocalizedText	Description of reason for abort.

**Figure 16 - Running To Completed Model**

### A.2.5.3 Sequence of Operations

Figure 17 illustrates a normal sequence of service exchanges between a *UA Client* and *UA Server* that would occur during the life cycle of a *DomainDownloadType Program Invocation*.

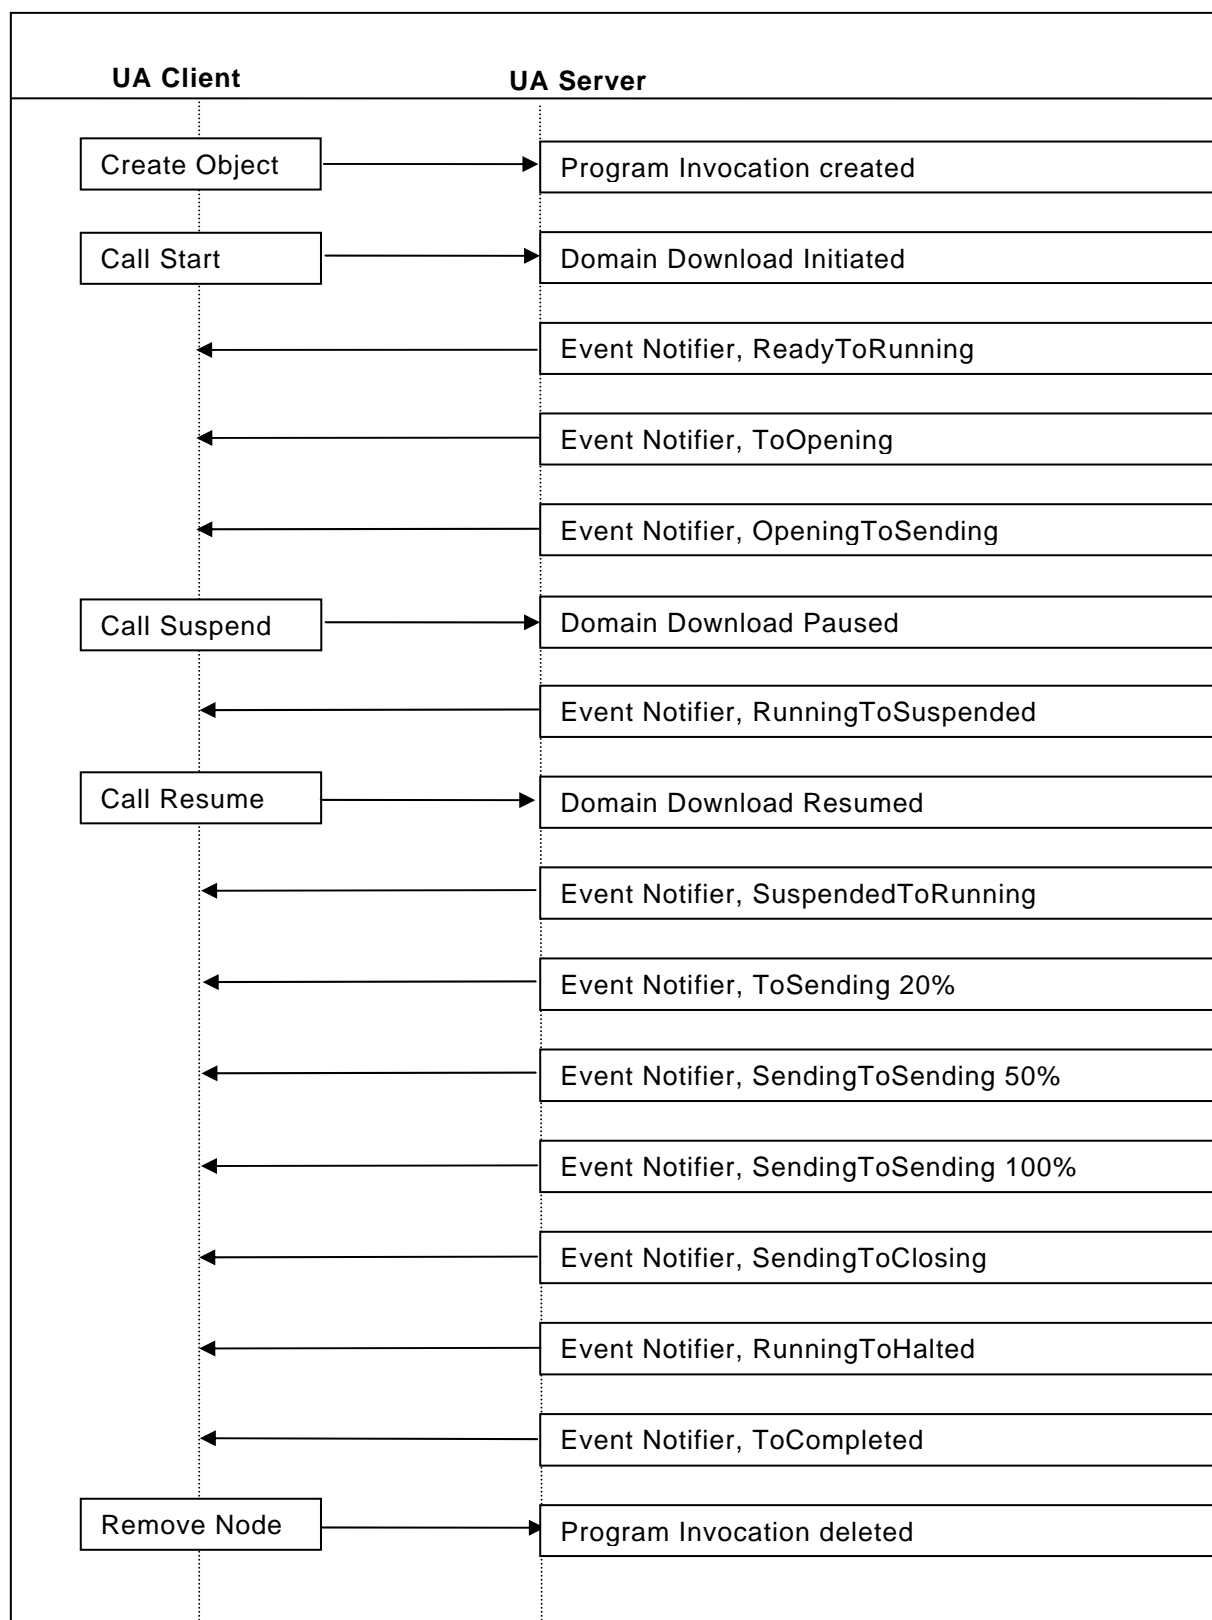

Figure 17 - Sequence of Operations

Final result Data
